

Font Report for fontreport.com/demo

Completed 10 Oct 2025

Test Page - FontReport Demo

Font analysis summary

Scanned 1 page in 2 seconds - **more pages exist that were not scanned**

3**FREE FONTS**

Free open-source fonts - no licence required

1**SYSTEM FONTS**

System fonts only - no licences required

**1****SELF-HOSTED**

Font files self-hosted that should have licenses verified

**1****THIRD-PARTY**

Hosted third-party fonts that should have licenses verified

**1****USER FONTS**

Declared in CSS only, requiring fonts to be installed on users' operating systems

7**TOTAL FAMILIES**

All font families detected

Actions required

Copyrighted font files have been detected on your website. You should check the copyright details for each font to ensure no licenses are required.

For each font listed, you should be confident that you either hold a license for these fonts, or that the fonts have been legitimately purchased through a third-party who has the rights to sell these fonts to you (for example, some website themes or plugins may come loaded with commercial fonts).

You should read the font licenses for commercial fonts purchased to ensure you are permitted to use them for web (most fonts have specific licenses for this), and for commercial purposes if required (free fonts often do not allow fonts to be used for commercial purposes without paying for a license).

Fonts have been detected from third-party locations. You should check subscriptions or licences are valid.

These fonts are loaded from a third-party location, such as a font CDN or subscription service. Often if your subscription has expired, these fonts will be failing to load and defaulting to the next fallback font in your CSS font family chain.

You should check that your subscription or licence is valid for the domain you are using the fonts on, and that your website traffic (page views) matches the font subscription limitations.

GDPR Compliance Notice – Google Fonts may transfer user IP addresses to Google servers. Consider self-hosting these fonts or switching font provider.

While Google Fonts are free to use, they may transfer user IP addresses to Google servers. For full GDPR compliance, consider:

- **Self-hosting:** Download and host the font files on your own server
- **Bunny Fonts:** Use fonts.bunny.net as a privacy-focused, drop-in replacement (simply replace fonts.googleapis.com with fonts.bunny.net in your code)

Some non-system fonts have been defined in your CSS files with no font files. This is not a license concern, but requires these fonts to be installed on your visitors' operating systems.

If you want to ensure all visitors to your website see these fonts (regardless of the font being installed on their individual computers), you should source licenses for these fonts and have them correctly loaded into your site.

Fonts appear to be loaded that are potentially unused in your website. You should review the Variants column to identify which weights may be safe to remove.

Some font variants (weights like Light, ExtraLight) appear to be loaded but are not explicitly used in your CSS font-weight declarations. Removing unused font weights can improve page load performance and reduce bandwidth costs.

This analysis examines your CSS to detect which font weights are explicitly used. The analysis cannot detect weights applied dynamically via JavaScript or complex inheritance patterns.

You should verify font usage across your actual website before removing any font files to make sure nothing breaks visually on your site.
